The transcutaneous jaundice meter is a medical device used to quickly and non-invasively measure the bilirubin level under the skin of newborns. By irradiating the skin with light of a specific wavelength, the detector is able to measure the light transmittance of the skin and thus estimate the concentration of bilirubin. This device is widely used in neonatology for early screening of jaundice to help doctors determine whether further treatment such as phototherapy is needed. The transcutaneous jaundice detector is easy to operate, painless and fast, which can reduce unnecessary blood sampling and facilitate real-time monitoring of the health status of newborns.
