Abstracts

Inflammatory heart disease refers to a group of conditions characterized by inflammation affecting the heart muscle, lining, or surrounding tissues, often resulting from infections, autoimmune responses, or systemic inflammatory diseases. Key types include myocarditis (inflammation of the heart muscle), endocarditis (inflammation of the inner lining, often involving heart valves), and pericarditis (inflammation of the outer sac surrounding the heart). These conditions can impair cardiac function, leading to complications such as arrhythmias, heart failure, or structural damage, and may arise from bacterial or viral infections, immune-mediated disorders like rheumatic fever, or as adverse reactions to certain medications. Diagnosis typically involves a combination of clinical evaluation, biomarkers (e.g., troponin, CRP), imaging (echocardiography, cardiac MRI), and sometimes biopsy, while treatment strategies focus on addressing the underlying cause, managing inflammation, and supporting heart function to prevent long-term sequelae.

The global Inflammatory Heart Disease market size was estimated at USD 10250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
