Report Overview:

Soft robotics is a subfield of robotics that concerns the design, control, and fabrication of robots composed of compliant materials, instead of rigid links. In contrast to rigid-bodied robots built from metals, ceramics and hard plastics, the compliance of soft robots can improve their safety when working in close contact with humans. Inflatable soft robots are much more than soft actuators for gripping delicate objects. They are rich dynamic structures capable of memory and computations all on their own. Carefully designed soft robotic systems therefore do not require any electronic control at all to perform complex functions. Instead, their geometry and materials automatically react to stimuli from the user or from the environment in a meaningful way. This concept is called embodied intelligence and promises extremely cheap, robust or small soft robots capable of autonomously executing tasks in complex environments. However, as of yet it is unclear how to design soft robots such that they accomplish a certain function automatically.

The Global Inflatable Soft Robotic Market Size was estimated at USD 1182.48 million in 2023 and is projected to reach USD 1557.66 million by 2029, exhibiting a CAGR of 4.70% during the forecast period.
