Abstracts

An infrared aspherical lens is an optical component designed specifically for use within the infrared wavelength spectrum, featuring a non-spherical surface profile that corrects for optical aberrations?such as spherical aberration, coma, and astigmatism?more effectively than traditional spherical lenses. By minimizing distortion and improving image quality, these lenses enable higher precision in applications requiring accurate infrared light transmission or detection, making them essential in systems where performance, size, and weight are critical factors. Typically manufactured from specialized infrared-transparent materials like germanium, zinc selenide, or chalcogenide glasses, these lenses are engineered to operate efficiently in demanding thermal and environmental conditions.

The global Infrared Aspherical Lens market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
