The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Infrared Display Card competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Infrared Display Card reached approximately 300,000 units, with an average selling price of approximately US\$180 per unit. The single-line production capacity is approximately 2,500 pieces/month, with an average gross profit margin of approximately 35-50%. Infrared Display Card is devices that convert invisible infrared light into visible light. They are used for detecting, tracking, and calibrating infrared beams and are commonly used in beam detection for semiconductor lasers, YAG lasers, and other applications. Their core principle is to utilize special fluorescent materials to absorb infrared energy and release it as visible light upon excitation, allowing users to visually visualize the location and approximate size of the infrared spot. The upstream core of Infrared Display Card is the supplier of specialty phosphors and optical-grade substrates. Their downstream applications are directly applied in areas such as optical path calibration for semiconductor lasers and YAG lasers, debugging military infrared equipment, beam visualization in scientific research experiments, and auxiliary inspection for industrial thermal imaging systems.

The global Infrared Display Card market size was estimated at USD 54.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
