Report Overview

An infrared dust sensor is a type of sensor that is used to detect the presence of dust particles in the air. It works by emitting infrared light and then measuring the amount of light that is scattered or reflected back to the sensor. When dust particles are present in the air, they can scatter the infrared light, causing a decrease in the amount of light that reaches the sensor. This change in light intensity is then converted into an electrical signal that can be used to indicate the presence and concentration of dust particles. Infrared dust sensors are commonly used in air quality monitoring systems, HVAC systems, and industrial applications to ensure clean and healthy environments.
