Abstracts

Infrared emitting diodes (IREDs) are semiconductor light sources that emit infrared radiation when an electric current passes through them, operating within wavelengths typically ranging from 700 to 1,100 nanometers, which is beyond the visible spectrum for human eyes. These devices are integral components in applications such as remote control systems, optical encoders, proximity sensors, security and surveillance systems (including night vision), and communication modules like IrDA. The market for IREDs is characterized by steady demand driven by their reliability, efficiency, and compatibility with various electronic and optoelectronic systems. Key growth factors include the expanding adoption of automation, the proliferation of smart home devices, advancements in automotive safety technologies (e.g., driver monitoring and LiDAR), and increasing integration into consumer electronics and industrial equipment. While the market is mature in some segments, emerging applications in biometrics, healthcare (e.g., pulse oximeters), and augmented reality present new opportunities. Competition is intense among established manufacturers, with innovation focusing on higher output power, improved energy efficiency, miniaturization, and enhanced thermal management to meet the evolving requirements of next-generation infrared sensing and transmission systems.

The global Infrared Emitting Diode market size was estimated at USD 350.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
