Report Overview

Infrared (IR), sometimes called infrared light, is electromagnetic radiation (EMR) with wavelengths longer than those of visible light. It is therefore invisible to the human eye. IR is generally understood to encompass wavelengths from around 1 milli-meter (300 GHz) to the nominal red edge of the visible spectrum, around 700 nano-meters (430 THz). Infrared Glass refers to allow infrared light to pass through the glass and reduce the loss of infrared light as much as possible. Because not all infrared light can easily pass through the glass. Near-infrared light can pass through glass like visible light, down to around 1.5 μ m. Glass absorbs around 3 μ m and above. Infrared glass materials include germanium, zinc selenide, zinc sulfur, magnesium fluoride, calcium fluoride, sapphire, chalcogenide glass, etc.
