Abstracts

An infrared grill is a type of grill that uses infrared radiation as a heat source to cook food. Unlike traditional grills that use convection (hot air) or conduction (direct contact with a hot surface), infrared grills rely on infrared emitters, which are heated by a gas burner or electric element, to produce intense radiant heat. This cooking method allows for faster, more even cooking and the ability to sear food at high temperatures.

The global Infrared Grills market size was estimated at USD 575.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
