Report Overview:

The technique of capturing and converting invisible infrared images into visible images is called infrared imaging. Visible light is easily detected by the human eye, but to see infrared light it is important to have infrared cameras and imagers. These devices possess special sensors that operate without the need of visible light. The radiations in the infrared imaging technique are emitted by the targeted objects or are reflected radiations. The imaging devices have infrared illuminator lasers with LEDs (Light Emitting Diodes) for the purpose of illumination. The infrared radiations emitted by warm objects are detected by thermal infrared imagers directing them to infrared sensor array. These sensor arrays convert infrared signals into electric signals which are then converted into an image.

The Global Infrared Imaging Market Size was estimated at USD 253.36 million in 2023 and is projected to reach USD 307.85 million by 2029, exhibiting a CAGR of 3.30% during the forecast period.
