Abstracts

Infrared light sources are devices that emit electromagnetic radiation within the infrared spectrum, which ranges from wavelengths of approximately 700 nanometers to 1 millimeter, and they are categorized into near-infrared (NIR), mid-infrared (MIR), and far-infrared (FIR) based on their specific wavelength bands and applications. These sources can be broadly classified into thermal emitters, such as blackbody radiators and ceramic heaters, which generate infrared radiation through heat, and non-thermal sources, including light-emitting diodes (LEDs), laser diodes, and gas discharge lamps, which produce infrared light through electronic or chemical processes without significant heat generation. Key performance parameters for infrared light sources encompass spectral range, output power, efficiency, stability, and coherence, with selection heavily dependent on the intended use case, whether it be for sensing, imaging, communication, heating, or scientific research.

The global Infrared Light Sources market size was estimated at USD 1680.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
