Report Overview

Infrared radiation thermometers gauge temperature based on the radiation released from an object. An object's ability to release radiation is called its emissivity—the more emissive an object is the more radiation a sensor has to work with. Sensors in this category include spot measuring devices that can produce 1-D and 2-D temperature readings, as well as thermal imaging thermometers which can display temperature data as a 2-D image. These types of visual representations are useful in terms of industrial processes because they can help identify potential problems or inconsistencies. In turn, the resulting feedback can provide increased quality and productivity. Radiation thermometers are seen in a vast number of fields, including playing key role in the medical industry where they monitor human temperature. Additionally, they can be used to help control and monitor building temperature and to maintain certain types of power generation.
