### Report Overview:

An infrared search and track (IRST) system, or known as infrared sighting and tracking system, is a method to detect and track objects emitting infrared radiation, such as jet aircraft and helicopters. IRTS system is widely used in security and surveillance in military and national defense fields, especially when stealth aircraft are found without radar.

The biggest advantage of IRST systems is that they do not emit any infrared radiation of their own, which makes them difficult to detect, which is different from radars that emit their own infrared characteristics.

In recent years, high-precision sensors, advanced image processing technology and advanced display system have further promoted the development of infrared search and tracking (IRST) system.

The Global Infrared Search and Track (IRST) System Market Size was estimated at USD 803.30 million in 2023 and is projected to reach USD 1082.67 million by 2029, exhibiting a CAGR of 5.10% during the forecast period.
