Abstracts

Infrared temperature sensors are non-contact devices that measure temperature by detecting the infrared energy emitted by an object, converting it into an electrical signal, and then translating that signal into a temperature reading based on the object's emissivity and the sensor's calibration. These sensors operate on the principle that all objects above absolute zero emit infrared radiation, with the intensity and wavelength distribution of this radiation being directly related to the object's temperature. They are valued for applications where direct contact is impractical, unsafe, or could alter the temperature being measured?such as in moving machinery, hazardous environments, electrically active systems, or medical settings?and they offer advantages including rapid response times, the ability to measure from a distance, and minimal interference with the target.

The global Infrared Temperature Sensors market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
