Report Overview

Infrared thermal imaging optoelectronic telescopes free hunters and wildlife watchers from the pursuit of being limited by the sparseness of ambient light and environmental barriers. These devices are particularly robust for rough handling in open and extreme weather conditions. The outer surface of the case is coated with thick rubber. Thermal optoelectronic telescopes are very immune to fogging and water damage inside the lens due to the use of dry nitrogen or argon for internal purging. In all other physical aspects, these thermal imagers intentionally mimic and imitate the use of classic daytime binoculars. Since humans are born to use both eyes, binoculars are the telescope of choice. Since both pupils dilate and contract the same, they can transition from viewing to shooting more quickly. Thermal imaging cameras have a very long detection range compared to night vision cameras. The addition of a built-in laser rangefinder enhances their capabilities. The downside of thermal imaging optoelectronic telescopes is the added weight and bulk.
