Report Overview:

Thermopiles are designed to measure temperature from a distance by detecting an object's infrared (IR) energy. The higher the temperature, the more IR energy is emitted. The thermopile sensing element, composed of small thermocouples on a silicon chip, absorb the energy and produce an output signal. A reference sensor is designed into the package as a reference for compensation. Thermopile infrared (IR) non-contact temperature measurement sensors are available with various lens, and filters allowing use in multiple applications, from industrial pyrometers, to climate controls and medical devices.

The Global Infrared Thermopile Sensor Market Size was estimated at USD 575.37 million in 2023 and is projected to reach USD 711.39 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
