Report Overview:

An infrared wall heater is a type of heater that uses infrared heating technology to warm up a room. This type of heater works by emitting infrared radiation, which heats up objects and people in its path, rather than heating up the air directly. The heat from an infrared wall heater is absorbed by objects in the room, which then radiate some of that heat back into the space, resulting in a more comfortable and efficient heating experience. Infrared wall heaters are typically installed on walls and are ideal for use in areas where a direct source of heat is needed, such as a bathroom or garage. They are also an energy-efficient choice, as they do not require a lot of electricity to operate.

The Global Infrared Wall Heater Market Size was estimated at USD 412.85 million in 2023 and is projected to reach USD 572.50 million by 2029, exhibiting a CAGR of 5.60% during the forecast period.
