Abstracts

A balloon catheter is an interventional medical device that usually includes a catheter body and an expandable balloon extending from the distal end of the catheter body. The design of this catheter allows doctors to deliver it to the target area in the body, such as blood vessels, bile ducts or other luminal structures, and then expand the balloon by inflating it with air or fluid to achieve a specific therapeutic effect. The perfusion balloon catheter adds a perfusion function to the conventional balloon catheter. This means that while the balloon is expanding, the catheter can also deliver liquids (such as drugs, contrast agents, etc.) to the target area to achieve a wider range of treatment or diagnostic purposes. This perfusion function makes balloon catheters more widely used in medical fields such as angioplasty, drug delivery, and biliary drainage.
