### Report Overview

Infusion manifolds are medical devices used to administer multiple intravenous (IV) therapies simultaneously, allowing healthcare providers to deliver fluids, medications, or nutrients to patients through a single access point. These devices typically consist of a central hub with multiple inlet ports, enabling the connection of several IV lines to a single catheter or needle, which enhances efficiency in critical care, anesthesia, and emergency medicine. Infusion manifolds are designed to minimize contamination risks, reduce tubing clutter, and improve workflow in high-intensity medical settings. They are commonly made from medical-grade plastics and may include features such as anti-reflux valves, pressure monitoring ports, and color-coded inlets for easy identification. Their applications span hospitals, ambulatory surgical centers, and home healthcare, catering to patients requiring complex or continuous IV therapy.
