## Abstracts

InGaAs monitor photodiodes are semiconductor devices primarily used to detect and measure light in the infrared (IR) range, typically from 800 nm to 1700 nm. These photodiodes are made from indium gallium arsenide (InGaAs), which is an alloy of indium arsenide (InAs) and gallium arsenide (GaAs). The unique properties of InGaAs, such as its high sensitivity to infrared light and low dark current, make it ideal for applications in telecommunications, fiber optic systems, spectroscopy, and environmental monitoring. InGaAs photodiodes are commonly used as monitoring sensors in optical systems to ensure accurate light intensity measurement and to maintain the stability of optical signals in real-time. They provide fast response times and high quantum efficiency, making them essential in applications requiring precise and reliable performance.

The global InGaAs Monitor Photodiodes market size was estimated at USD 78.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
