Abstracts

Inguinal hernia prostheses are medical devices used to repair weakened or damaged abdominal wall tissue in the groin area, typically consisting of synthetic mesh materials designed to reinforce the abdominal wall and prevent organ protrusion through the inguinal canal. These prostheses are surgically implanted either via open repair or minimally invasive laparoscopic techniques, providing mechanical support to facilitate tissue ingrowth and long-term stability. The mesh materials commonly include polypropylene, polyester, or biologic substrates, with variations in weight, porosity, and structure tailored to reduce complications such as infection, chronic pain, or recurrence. The primary function is to restore anatomical integrity while minimizing postoperative discomfort and accelerating recovery, making these devices a cornerstone of modern hernia repair surgery.

The global Inguinal Hernia Prosthesis market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
