Abstracts

Inhalation anesthetic drugs are pharmaceutical compounds administered via inhalation to induce and maintain a state of general anesthesia, characterized by reversible loss of consciousness, amnesia, analgesia, and muscle relaxation, allowing for painless surgical or diagnostic procedures; these drugs typically include volatile liquids (such as sevoflurane, isoflurane, and desflurane) that vaporize for delivery through specialized anesthesia machines, as well as gaseous agents like nitrous oxide, all acting primarily on the central nervous system by modulating neurotransmitter receptors?particularly GABA_A and NMDA receptors?to produce their effects, with properties such as rapid onset and offset, precise controllability of depth of anesthesia, and minimal metabolism making them indispensable in modern surgical settings across hospitals, ambulatory surgery centers, and emergency care.

The global Inhalation Anesthetic Drugs market size was estimated at USD 1547.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
