Report Overview

Isoflurane is a widely used inhalational anesthetic agent employed in general anesthesia. It is a halogenated ether with the chemical formula $C_2H_2ClF_2O$, and it functions by inducing a reversible loss of consciousness and sensation in patients undergoing surgical procedures. Isoflurane acts on the central nervous system by enhancing the inhibitory effects of neurotransmitters and disrupting neural pathways that mediate awareness and sensation. It is favored in clinical settings due to its stable cardiovascular effects, ease of control, and minimal metabolism by the liver. Its administration requires specialized equipment to ensure accurate delivery and maintenance of the desired anesthetic depth.
