Report Overview

κ B inhibitors refer to a class of compounds or biomolecules whose main function is to inhibit the activity of the nuclear factor κ B (NF- κ B) signaling pathway. NF- κ B is an important transcription factor that participates in regulating gene transcription in cells and affects physiological processes such as cellular inflammation, immune response, and cell proliferation. In the inactive state, NF- κ B remains in the cytoplasm by binding to the Inhibitor of κ B (I κ B) protein. When stimulated (such as inflammatory factors, bacterial infection, etc.), the I κ B protein will be degraded, leading to the activation and translocation of NF- κ B into the nucleus, thereby regulating the transcription of downstream genes.
