Abstracts

Injectable veterinary dermatology involves the use of injectable medications to treat various skin conditions in animals. This approach is often employed when a rapid and targeted response is needed, such as in cases of severe allergies, infections, or inflammatory skin diseases. Common injectable treatments include corticosteroids for managing acute inflammation, antibiotics for bacterial infections, and immunotherapy injections for chronic allergies. Injectable solutions offer the advantage of delivering medication directly into the bloodstream or affected area, providing quick relief and reducing the need for frequent dosing. This method is particularly beneficial for animals that may not tolerate oral medications well, ensuring effective and efficient management of dermatological conditions.

The global Injectable Veterinary Dermatology market size was estimated at USD 3284.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
