Abstracts

Injection anesthetic drugs are pharmaceutical agents administered via parenteral routes (intravenous, intramuscular, subcutaneous, or regional techniques) to induce a reversible loss of sensation, either locally in a specific area or systemically to achieve unconsciousness, enabling pain-free surgical, diagnostic, or therapeutic procedures; these drugs are categorized based on their mechanism and duration of action?such as general anesthetics (e.g., propofol, etomidate), local anesthetics (e.g., lidocaine, bupivacaine), and adjuncts like neuromuscular blocking agents?and are critical in hospital operating rooms, ambulatory surgery centers, dental clinics, and emergency medical settings. The market is driven by the global rise in surgical volumes, increasing prevalence of chronic diseases requiring intervention, advancements in drug formulations for improved safety profiles, and growing demand for outpatient procedures, though it faces challenges such as stringent regulatory requirements, potential side effects, pricing pressures, and the need for specialized administration by trained healthcare professionals.
