Abstracts

Injection general anesthetics are a class of medications administered intravenously to induce a state of unconsciousness and insensitivity to pain during surgical procedures. These drugs work by rapidly and effectively altering brain function to produce loss of awareness and sensation. Unlike inhalational anesthetics, which are administered through the respiratory system, injection general anesthetics are delivered directly into the bloodstream, allowing for precise control over the depth and duration of anesthesia. Examples include propofol, which is known for its rapid onset and short duration of action, and thiopental, which has a longer history of use. These medications are crucial for various medical and surgical interventions, ensuring that patients remain comfortable and immobile throughout procedures.

The global Injection General Anesthetics Drug market size was estimated at USD 2806.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
