Abstracts

Injection grade polypropylene oxide elastomer is a kind of high-performance polyolefin, which becomes rubber elasticity at room temperature, and has the characteristics of low density, large bending, high impact resistance at low temperature, easy processing, and reusability. Rising consumption in various applications such as automotive, electrical & electronics, industrial medical, consumer goods, and consumer goods have played a major role in the growth of the industry globally over the past few years. Increase in demand for auto parts manufacturing is expected to be a major factor driving the global industry over the forecast period. Regulatory intervention by environmental agencies aimed at reducing carbon emissions through improved fuel efficiency has forced major auto OEMs to adopt plastics as an alternative to metals and alloys in vehicle components. Increasing consumer preference for high-performance and lightweight passenger vehicles is driving innovation in plastics in automotive manufacturing. These factors have led to an increase in the consumption of thermoplastics in the above-mentioned applications. Thermoplastic elastomers (TPEs) exhibit superior physical and chemical properties compared to thermosets and are therefore favored in terms of applications. High substitution rate of TPU and TPO as a substitute for ethylene propylene diene rubber (EPDM) in construction materials is expected to supplement the global industry demand over the forecast period.

The global Injection Grade Polypropylene Oxide Elastomers market size was estimated at USD 1809.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
