## Abstracts

Injection molded magnets are permanent magnets produced by combining magnetic powders, such as neodymium-iron-boron (NdFeB), strontium ferrite, or samarium-cobalt, with a polymer binder (typically nylon, polyphenylene sulfide, or other thermoplastics) and forming them into complex net-shape or near-net-shape components via injection molding. This manufacturing process allows for the integration of intricate geometries, tight tolerances, thin walls, and multi-pole magnetization patterns that are difficult or impossible to achieve with traditional sintered or bonded magnets, while offering advantages such as corrosion resistance without additional coatings, reduced material waste, and high-volume production scalability. These magnets are characterized by their mechanical robustness, design flexibility, and suitability for applications requiring lightweight, compact, and multifunctional magnetic assemblies.

The global Injection Molded Magnets market size was estimated at USD 365.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
