## Abstracts

Injection molding robots, also called robotic automation systems for injection molding, are programmable mechanical devices designed to automate specific tasks within the injection molding production cycle, such as part removal, insert loading, sprue picking, quality inspection, and post-molding operations like degating or assembly. These robots are integrated directly into injection molding machines and are engineered to operate in high-temperature, high-precision industrial environments, improving production efficiency, reducing cycle times, minimizing human error and labor costs, and enhancing workplace safety by handling repetitive or hazardous tasks. They range from simple Cartesian (linear) robots for basic part extraction to sophisticated multi-axis articulated robots capable of complex manipulations and secondary operations, with configurations often customized based on part geometry, material, and production requirements.

The global Injection Molding Robots market size was estimated at USD 5216.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
