## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Injection of Fat Dissolving Needle competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of injectable lipolysis needles will reach 638,000 units, with an average selling price of US\$500 per unit. Lipolysis injections are a medical aesthetic product or treatment that uses a minimally invasive method to directly inject specific fat-degrading drugs (such as phosphatidylcholine and deoxycholic acid) into areas of localized fat accumulation. The principle is to induce the rupture and dissolution of fat cells through the drug, which are then naturally excreted through the body's metabolism, thereby achieving localized body shaping and reducing fat thickness. This method is typically used to treat areas of localized fat accumulation, such as the face, chin, abdomen, and arms. It is characterized by its ease of use, short recovery period, and minimal invasiveness. However, it must be performed under the guidance of a professional physician to ensure safety and effectiveness.

The global Injection of Fat Dissolving Needle market size was estimated at USD 319.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.20% during the forecast period.
