Abstracts

Inline bypass switches are specialized networking devices that provide a fail-safe mechanism for inline security appliances, such as firewalls, intrusion prevention systems (IPS), or deep packet inspection (DPI) tools, by allowing traffic to bypass the appliance in the event of hardware failure, maintenance, or performance degradation, thereby ensuring uninterrupted network availability without compromising the integrity of the primary security infrastructure. These switches operate by automatically or manually rerouting network traffic around the connected appliance when issues are detected, maintaining seamless data flow while enabling administrators to service or replace equipment without causing network downtime, making them critical components in high-availability and security-sensitive environments where continuous uptime and robust protection are paramount.

The global Inline Bypass Switches market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
