## Abstracts

An inline bypass TAP, sometimes referred to as a Bypass Switch, has consistent heartbeats that are sent to an inline security appliance. These heartbeats indicate the functionality of the security appliance: regular beats mean the bypass TAP is functioning well. If the beats are not returned to the bypass TAP (see below) the TAP automatically bypasses the appliance to allow the packets to be sent through, no matter how high the traffic is. It is also able to detect the status of the appliance, so when it comes back online, this is detected by the TAP and traffic is once again directed through the appliance.?

The global Inline Bypass TAPs market size was estimated at USD 149.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
