## Abstracts

Inorganic ceramic binders are specialized materials composed of mineral-based compounds, such as phosphates, silicates, or aluminates, which provide cohesion and structural integrity to ceramic formulations without organic components; these binders function by undergoing chemical reactions, often through hydration or thermal processes, to form stable bonds between ceramic particles, enabling the formation of green bodies with sufficient strength for handling before high-temperature sintering, where the binder either integrates into the ceramic matrix or decomposes cleanly without leaving carbonaceous residues.

The global Inorganic Ceramic Binders market size was estimated at USD 50.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
