Abstracts

Inorganic ceramic coating is a pure inorganic water-soluble silicate coating produced by gel process. Inorganic solvent and inorganic pigment are used as raw materials. The main characteristics of inorganic ceramic coatings are good fire resistance, corrosion resistance, and ultra-high hardness. This coating is made of pure inorganic materials, and even under high temperature, it will not burn because it does not contain flammable components inside. Inorganic ceramic coatings are used in high-temperature areas to provide anti-corrosion, wear-resistant, or energy-saving effects. The failure of inorganic ceramic coatings is mainly due to detachment, so increasing the adhesion of inorganic ceramic coatings is of utmost importance. Inorganic ceramic coatings are coatings mainly composed of inorganic polymers as film-forming substances, supplemented with inorganic pigments, fillers, and additives. It is usually divided into two categories: water-based inorganic ceramic coatings and solvent based inorganic ceramic coatings, among which water-based inorganic ceramic coatings are more popular due to their excellent environmental performance. In small household appliances such as rice cookers, frying pans, induction cookers, hair clips, and kitchen utensils, protective coatings are a crucial material, especially for products that come into direct contact with food such as rice cookers and electric frying pans. They play a vital role in the overall product quality, and the quality of the protective coating directly affects the health and convenience of consumers. Therefore, such protection must meet requirements such as high temperature resistance, corrosion resistance, wear resistance, environmental friendliness, and long service life. For products such as rice cookers and electric frying pans, non stick coatings are also required. The reason why inorganic ceramic coatings have achieved great success since their launch is that water-based nano ceramic coatings are mainly composed of nano inorganic compounds such as SiO₂, Al₂O₃, TiO₂, etc., overcoming the problems of poor fire resistance, flame resistance, and hardness of water-based coatings mainly composed of organic emulsion resins. They

can withstand high temperatures above 600 °C and have the characteristics of stable, wear-resistant, and flame-retardant inorganic raw materials. They are excellent materials for efficient metal protective coatings and can be widely used in various products such as non-stick pans, heat pipes, and building aluminum curtain walls.
