## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Inorganic Germanium Compounds competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Inorganic Germanium Compounds are chemical compounds composed of the element germanium (Ge) bonded with elements other than carbon, typically including oxygen, sulfur, chlorine, fluorine, and nitrogen. Unlike organogermanium compounds which contain carbon-germanium bonds, inorganic germanium compounds are characterized by ionic or covalent bonding with non-carbon elements, often forming oxides, halides, sulfides, or nitrides. Common examples include germanium dioxide (GeO<sub>2</sub>), germanium tetrachloride (GeCl<sub>4</sub>), and germanium disulfide (GeS<sub>2</sub>). These materials are widely utilized in semiconductor fabrication, fiber optics, infrared optics, glass manufacturing, alloy production, and catalysis due to their high refractive index, transparency to infrared light, and unique electronic properties. They serve as critical intermediates in the purification of elemental germanium and as precursors for organometallic and optoelectronic applications.

The global Inorganic Germanium Compounds market size was estimated at USD 74.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
