Report Overview

Inorganic metal finishing processes involve applying a thin layer of metal onto a substrate to enhance its properties such as corrosion resistance, conductivity, and aesthetics. These processes typically include electroplating, anodizing, and chemical conversion coatings. Electroplating involves using an electric current to deposit a metal coating onto the substrate, while anodizing creates a protective oxide layer on metals like aluminum. Chemical conversion coatings change the surface properties of the substrate through chemical reactions. Inorganic metal finishing processes are widely used in industries such as automotive, aerospace, electronics, and construction.

The market for inorganic metal finishing processes is driven by several factors. The increasing demand for durable and corrosion-resistant metal products in industries such as automotive and aerospace is a key driver of market growth.
