Abstracts

Inorganic oxygen scavengers are chemical compounds, typically based on sulfite, hydrazine, or carbohydrazide chemistries, that are added to industrial water systems?such as boiler feedwater, cooling circuits, and oilfield injection water?to remove dissolved oxygen, thereby preventing corrosion, pitting, and scale formation in pipelines, heat exchangers, and equipment. As non-organic alternatives, they are often selected for their thermal stability, effectiveness at high temperatures and pressures, predictable reaction rates, and lower risk of microbial contamination compared to organic scavengers, making them a critical component in extending asset lifespan and maintaining operational efficiency across power generation, oil and gas, chemical processing, and manufacturing industries.

The global Inorganic Oxygen Scavengers market size was estimated at USD 78.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
