Abstracts

Inorganic plastic pigments are colorants derived from mineral or metallic compounds, such as titanium dioxide (white), iron oxides (reds, yellows, browns), chromium oxide (green), and cadmium or chromium-based pigments (yellows, oranges, reds), which are incorporated into plastic matrices during manufacturing to impart color, opacity, UV stability, and heat resistance without undergoing chemical changes themselves. These pigments are valued for their excellent lightfastness, thermal stability, and resistance to migration or bleeding, making them suitable for demanding applications in automotive parts, construction materials, packaging, consumer goods, and textiles where long-term color consistency and durability are critical, though they face growing scrutiny and substitution pressures in some segments due to regulatory concerns over heavy metal content (e.g., cadmium, lead) and increasing environmental and health regulations favoring organic or bio-based alternatives in certain regions.

The global Inorganic Plastic Pigment market size was estimated at USD 1420.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
