Abstracts

Inorganic Polymer Flocculant (IPF) is a type of chemical agent used to remove suspended solids and particles from liquids in processes such as water and wastewater treatment. These flocculants are composed of inorganic compounds, typically metal-based, with polymeric structures that have high molecular weights and charge densities. Their main role is to enhance the agglomeration (flocculation) of fine particles into larger clumps, or flocs, which can then be more easily separated from the liquid phase.

The global Inorganic Polymer Flocculant market size was estimated at USD 5990.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Inorganic Polymer Flocculant market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
