Abstracts

Inorganic rheological additives refer to a type of chemical substances used to change the flow properties of materials based on non-organic chemical substances. These additives are commonly used in a variety of industrial and engineering applications to adjust the rheological properties of substances, such as viscosity, rheology curves, and rheological properties. Inorganic rheology additives generally have higher thermal resistance and chemical stability than organic rheology additives and are suitable for use in more extreme conditions. Common inorganic rheological additives include alumina, silica, silicates, aluminum hydroxide, etc. They can change the rheological properties of materials through adsorption, filling, hydration, etc., such as increasing the viscosity of materials, improving suspension, controlling rheological curves, etc. These additives are widely used in various industries, including coatings, paints, adhesives, plastics, ceramics, cement and other fields. They can help tune product performance, improve production efficiency, and meet specific process requirements.

The global Inorganic Rheological Additives market size was estimated at USD 364.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
