Abstracts

Inorganic scintillating materials are a class of compounds that emit light (scintillation) when exposed to ionizing radiation, such as X-rays, gamma rays, or charged particles. These materials, typically crystals or ceramics, are widely used in applications like medical imaging (e.g., CT scanners), high-energy physics, radiation detection, and security screening. Inorganic scintillators, such as sodium iodide (NaI), cesium iodide (CsI), and bismuth germanate (BGO), are valued for their high density, effective atomic number, and light yield, which contribute to their ability to detect radiation efficiently and with good spatial resolution. Their performance is influenced by properties such as energy resolution, decay time, and radiation hardness.

The global Inorganic Scintillating Materials market size was estimated at USD 286.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
