Abstracts

Inorganic soil amendments are non-living materials, primarily mineral-based substances such as perlite, vermiculite, sand, gypsum, lime, rock phosphate, and various synthetic or processed compounds, which are added to soil to improve its physical or chemical properties without directly contributing significant organic matter; these amendments function by altering soil structure (enhancing aeration, drainage, or water retention), adjusting pH levels, correcting nutrient deficiencies, or remediating contaminated soils, and they are distinct from organic amendments like compost or manure due to their mineral origin, longer-lasting effects, and targeted functionality in agricultural, horticultural, landscaping, and environmental restoration applications.

The global Inorganic Soil Amendments market size was estimated at USD 2100.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
