Abstracts

Inorganic zinc coatings are specialized anti-corrosive coatings primarily composed of zinc dust suspended in an inorganic silicate binder, which undergo a chemical curing process upon exposure to atmospheric moisture to form a durable, abrasion-resistant protective layer; these coatings function as sacrificial anodes, where the zinc corrodes preferentially to the underlying steel substrate, thereby providing long-term cathodic protection even in harsh environments such as marine, industrial, or offshore applications. The market for inorganic zinc coatings is driven by demand from industries requiring high-performance corrosion protection, including oil and gas, marine, infrastructure, and power generation, with growth influenced by factors such as infrastructure investment, regulatory standards for asset longevity and safety, and advancements in coating formulations that enhance application efficiency and environmental compliance. Key market dynamics include competition from organic zinc-rich primers and other protective systems, raw material price volatility (particularly zinc metal), and increasing emphasis on low-VOC and sustainable coating technologies, while regional demand varies with industrial activity, climatic conditions, and enforcement of environmental and safety regulations.

The global Inorganic Zinc Coatings market size was estimated at USD 845.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
