Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on InP Semi-Insulating competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Indium phosphide (InP) is a second-generation compound semiconductor material with the advantages of high electron mobility, good radiation resistance, and large bandgap. It has key advantages in the field of photons and radio frequency and is the first choice for military communications, radar, radiation measurement, and automatic test equipment. The price of a single 300mm large silicon wafer of Shanghai Silicon Industry is about 314 yuan, while the price of a 6-inch semi-insulating gallium arsenide wafer is 200 US dollars, and the price of a 4-inch semi-insulating indium phosphide wafer is as high as 1,000 US dollars, which shows that the price of compound semiconductors such as indium phosphide and gallium arsenide wafers is much higher than that of silicon wafers. The emergence of semi-insulating indium phosphide (InP) wafers is of great significance for improving and enhancing the performance of InP-based microelectronic devices. This semi-insulating wafer prepared by high-temperature annealing process not only maintains the high resistance characteristics of the traditional native iron-doped substrate, but also greatly reduces the iron concentration, and significantly improves the electrical properties, uniformity and consistency. Indium phosphide is another important III-V compound semiconductor material after silicon and gallium arsenide. Indium phosphide wafers are often used to manufacture high-frequency, high-speed, high-power microwave devices and circuits, as well as solar cells for satellites and outer space. In the rapidly developing field of optical fiber communications, it is the preferred substrate material. In addition, InP-based devices also have advantages in IC and switch applications. The successful development of this new semi-insulating indium phosphide wafer will play an important

role in the fields of national defense and high-speed communications.

The global InP Semi-Insulating market size was estimated at USD 74.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.40% during the forecast period.
