## Abstracts

Inpatient management software is a specialized system designed to streamline the operations and management of inpatient care within healthcare facilities, such as hospitals and rehabilitation centers. This software helps healthcare providers efficiently manage patient admissions, treatment plans, and overall care processes for patients who are admitted for overnight stays or longer. Medical software, also known as hospital information management systems, is a cutting-edge science that integrates multiple disciplines, including medicine, information, management, and computer science. It has been widely used in developed countries, generating significant social and economic benefits. Medical software is essential technical support and infrastructure for modern hospital operations. The purpose of implementing medical software is to strengthen hospital management, improve efficiency, and enhance medical quality through more modern, scientific, and standardized methods, thereby establishing a new image for modern hospitals. This is also the inevitable direction of future hospital development. Technologies such as artificial intelligence, big data, and cloud computing are increasingly being used in inpatient management software. For example, AI assists with medical record analysis and intelligent scheduling, big data optimizes resource allocation, and cloud computing improves system stability and scalability. The application of these technologies not only improves management efficiency but also enhances the precision and personalization of medical services. Hospitals' demand for inpatient management software is no longer limited to basic bed management and expense settlement functions; it is now more focused on deep integration with clinical operations, such as supporting multidisciplinary collaboration, telemedicine, and end-to-end patient management. At the same time, patients' increasing expectations for their healthcare experience are driving continuous improvements in software convenience and transparency.

The global Inpatient Management Software market size was estimated at USD 1013.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
