Abstracts

An InSb photovoltaic detector is a semiconductor-based optoelectronic device that utilizes indium antimonide (InSb) as the sensing material, operating on the principle of the photovoltaic effect to convert infrared radiation in the mid-wavelength infrared (MWIR) range, typically 3-5 μ m, directly into an electrical signal without the need for external bias. These detectors are characterized by high detectivity, fast response times, and excellent sensitivity at cryogenic temperatures, often achieved using Stirling coolers, making them well-suited for applications requiring precise infrared detection and imaging, such as in military and aerospace systems (e.g., missile guidance, surveillance), scientific instrumentation (e.g., spectroscopy, astronomy), and industrial process monitoring (e.g., temperature measurement, gas analysis).

The global Insb Photovoltaic Detector market size was estimated at USD 120.35 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
