Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Insect Products as Feed competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Insect products as feed refer to the use of insects (such as mealworms, black soldier flies, silkworms, etc.) as raw materials, which are bred, processed, and extracted into high-quality feed ingredients for livestock, poultry, and aquaculture. Insects are rich in protein, essential amino acids, fats, vitamins, and minerals, making them an ideal alternative feed source. Compared to traditional feed ingredients such as soybeans and fishmeal, insect-based feed offers significant advantages in terms of resource consumption and environmental impact. Insects have a short growth cycle, high reproductive capacity, and require minimal land and water, making them a more sustainable and environmentally friendly feed source. Insect-based feed not only provides animals with high-quality nutrition to improve growth performance but also helps reduce the use of antibiotics and chemical additives in animal feed. With the growing global focus on environmental protection, sustainable agriculture, and alternative proteins, the use of insects as feed is gaining widespread recognition and showing tremendous potential in the livestock industry. Insect feed presents an innovative solution for the food and feed industries by reducing resource waste and improving production efficiency. For the 'Insect Products as Feed' segment globally (insect-derived products used in animal feed), production in 2024 is estimated at around 15,000-50,000 tonnes, with unit prices in the range of USD 3,000-6,000 per tonne.
