Abstracts

At present, the basic means of pest control in agricultural production still mainly rely on chemical pesticides, but the long-term and uncontrolled use of chemical pesticides has brought many side effects. First, the emergence of pest resistance has led to the continuous increase in the amount and concentration of pesticides used, the cost has increased year by year, and prevention and control has become increasingly difficult; second, it destroys the ecological balance. While preventing and controlling pests, a large number of natural enemies are killed, causing the rampant harm of secondary pests; third, it pollutes the environment. A large amount of pesticide residues remain in crops, soil, rivers, lakes and seas, and are enriched in the human body through the food chain, causing further harm to humans. Relevant research departments at home and abroad are working hard to explore and study new ways and technologies for pest control. These studies include: the development of new, efficient, environmentally friendly, low-toxic, and low-residue chemical insecticides; the use of natural enemy insects and microbial pesticides; the application of insect sterilization technology and insect hormones; among them, the use of insect hormones, especially the use of insect pheromones for pest control is increasingly attracting people's attention and attention. Insect pheromones, also known as insect sex pheromones or insect external hormones, are chemical factors secreted or excreted by insects, which are used to trigger social responses among members of the same species. These chemical pheromones transmit various information such as aggregation, foraging, mating, and vigilance among insects, and are the chemical molecular language of insect communication. With the continuous growth of global insect production and the increasing attention to environmental protection and ecological balance, the market size of agricultural pheromones, as a green and efficient pest control method, has shown a steady growth trend. Insect pheromones have important applications in agricultural production, mainly used to prevent and control crop diseases and insect pests. By utilizing the disorientation

technology of insect pheromones, the mating behavior of pests can be interfered with, thereby reducing the population density of pests, reducing the use of pesticides, and ensuring the safety and quality of agricultural products. In addition, insect pheromones can also be used in many fields such as plant quarantine and regional surveys of insects. Insect sex pheromones are chemical substances produced and released by female insects to attract of the same species for mating purposes. These pheromones are species-specific and serve as highly effective communication signals in the insect world. They are often volatile compounds that are released into the air, where they can be detected by male insects through sensory receptors, allowing them to locate and mate with the female. Insect sex pheromones play a crucial role in regulating the reproductive behavior of insects, influencing mating patterns, population dynamics, and even pest control strategies. They are extensively studied and utilized in various fields, including agriculture, entomology, and pest management. The industry trend of insect sex pheromones is driven by a growing interest in sustainable and environmentally friendly pest control practices. Pheromone-based technologies offer precise and targeted control measures, reducing the need for chemical insecticides. There is an increasing focus on developing pheromone formulations that are more effective, long-lasting, and economically viable for widespread use. Continuous research and advancements are being made in synthesizing and formulating specific pheromones to attract and trap insect pests. Additionally, innovations in delivery systems, such as pheromone lures and dispensers, are being developed to improve their efficiency and ease of application. The trend is towards integrated pest management approaches that incorporate pheromones as a key component for sustainable insect pest control in agriculture and other sectors. The global insect sex pheromone market presents a diversified competitive situation. Major manufacturers include Shin-Etsu, BASF, Sutterra, Biobest Group, Provivi and other well-known companies, which have occupied a certain share in the market with their respective technological advantages, product characteristics and market layout.
