Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Insoluble Quantum Dots competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Insoluble quantum dots (QDs) are quantum dot materials that do not exhibit good dispersibility in common organic solvents, water, or alcohols, typically existing as dry powder or aggregates. These QDs retain their core optical and electrical properties, but due to short or unmodified surface ligands, they exhibit poor stability in solution, requiring post-processing (such as high-temperature melting, polymer coating, and mechanical dispersion) before application in device fabrication. The product is priced at approximately \$220 per gram, with global sales of approximately 582 kilograms. The upstream of the insoluble quantum dot industry chain includes semiconductor precursors (such as Cd, In, and Pb), surface ligands and crystallization aids (such as thiols and phosphate esters), and nanoreactor equipment for high-temperature synthesis; the downstream encompasses LED packaging plants, optical film and thin film manufacturers, security material and ink companies, as well as research institutions and university laboratories. The market is accelerating its transition to cadmium-free, environmentally friendly systems (such as InP and perovskite), while simultaneously driving improvements in powder stability and dispersibility, and deep integration with thermosetting resins and UV curing systems to enhance high-temperature and photothermal stability. Overall gross margins remain between 35% and 55%, indicating strong profit potential and the ability to upgrade technology.

The global Insoluble Quantum Dots market size was estimated at USD 128.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
